

THE ESSENCE OF  
**ACCURACY**  
*Dragonfly* APS DRAGONFLY DUAL POWER PISTOL

Lord Sith

0'20

APS

The time has come, you prepare, relax the neck, the arms, and your fingers move slightly ... your hand drops to the waist, you pull out the gun and, as if it was part of a dance, you have already shot all targets before the music stops.

3 gun match, it makes no difference. It is essentially the same; only accuracy matters, and for these occasions the guys at APS have spent 9 hard months of research and development. To make sure you do not miss.

Whether you are in the middle of a MilSim event, an IPSC tournament or a

# WHY DOES IT STAND OUT?

## STAY AWAY FROM THE 3 DOTS

The sights are made of optic fibre in different colors to quickly align the red dot between the green ones. Furthermore, since they are made of optical fibre, they are highly visible under any light, thus making aiming easier. Otherwise we can always replace the rear sight with an APS slide (not included) on which to assemble a mini red dots (RMR).

## CLOSE, BUT NOT QUITE A GLOCK

The replica is designed as a Glock but its trigger is entirely different. It does not have the "Safe Action" trigger safety system with the distinctive toggle lever in the middle. However, it has a safety pin that can only be used if the replica is cocked.

## STIPLING "SPECIAL FORCES" STYLE

Stippling is an abrasion process made by some operators on their guns, it can be seen throughout the whole gun, and makes the replica slip-resistant. It is found not only on the grip panels, but also on several areas around the trigger so that we can comfortably and safely rest our finger, reducing any risk of slipping.

## A SLIDE WITH A PERSONALITY OF ITS OWN

The lightweight design of the slide has openings in the front showing the inner barrel in the style of Salient Arms models. It has a slide cover with the logo of the model that can be changed for other APS' models.

## TURNING CO2 AROUND

It has a patented design that enhances gasification. Most notably, the tank is inserted upside down. But, even more interesting, is its dual closure system in which the tank is not punctured until the space is fully sealed and no gas is leaked. It also has a locking system that prevents it from opening until the CO2 tank is empty.

## GAS OR CO2?

The model is compatible with gas and CO2, which in both cases holds a 23 BBs magazine. With a single CO2 tank we can fire an average of 68 balls at 345 FPS, while a gas load offers an average of 57 balls at 258 FPS, always with 0.20 g BBs in a room at 19 °C.

## THE KEY IS IN THE SKULL

To open and close the magazine compartment, the gun includes a skull-shaped key (the Hakkotsu logo). The H inside, besides representing "Hakkotsu", will help us close it firmly.

## REINFORCED INTERIOR

The inner barrel measures 6.03 mm and has a standard length. Although thanks to the internal thread of the outer barrel we can mount a silencer and use the 190 mm barrel that APS offers.

A truly impressive model and the touch of the stippling finish which we mentioned earlier contributes significantly to it. The first time we tried it we got carried away, drew quickly, and scraped the palm of our hand. Once you realize this, you put on your gloves and get ready to enjoy it in all its glory.

While testing, it reminded us of its predecessor a great deal: the ACP. We are hitting targets at 30 meters so accurately that we feel we can move it further back to the 40 meters mark... and still hit it is easily. So we go all in,

and place it all the way back. But of course, at 60 meters distance we can-

not expect a pistol to achieve what not many AEGs can. However, it is one of the best pistols we have ever tried at 0'20.

The difference between the gas load and the CO2 is evident, and yet the performance we achieve with the gas is higher than what we would achieve with other brands. And, since it is as a more reliable option in changing weather conditions, we prefer the CO2 option.

It not only about the great recoil power or its attractiveness and originality, it is also the surprising accuracy in which you will hit targets at 40 meters, an accuracy which will surely surprise other players under your sights too.

# EXPERIENCE

# CHARACTERISTICS

# Dragonfly

Manufacturer: APS

Model: Dragonfly

Velocity: 285 FPS (gas) / 345 FPS (CO2) with 0.20 g BBs at 19°C

Power Source: Gas/CO2

Blowback: Yes

Inner barrel length: 136 mm

Magazine capacity: 23 BBs

Inner barrel diameter: 6.03 mm

Weight: 900 g
